

To Whom It May Concern,

Comment submissions to Docket #8167.

What method should the third party sound testing organization be required to use that demonstrates to the Board the real-world turbine-only sound emitting for wind energy commercial facilities, since as the sound reaches the maximum allowable decibel levels wind on the sound testing equipment itself begins to mask the sound created by turbines?

Should the Board investigate the current ability (state-of-the-science) of the sound testing industry to accurately determine the real-world turbine-only sound as perceived by the average human ear that are emitted from commercial wind energy facilities as the decibels approach the maximum allowable levels?
